RE: Sites Management Activity Complete at the Roxbury Town Garage (Site #96-1963)

Dear Mr. Twombly:

On May 16, 1996, a representative from the Vermont Department of Environmental Conservation, Sites Management Section (SMS) was onsite to complete an initial site assessment at the above referenced site. This work was performed in response to the removal of one diesel fuel underground storage tank (UST) on January 10, 1996. A private environmental consultant was not present onsite to collect pertinent information about subsurface conditions during the removal activities. Based on the observations during the completion of this site assessment, the SMS can now conclude the following at this site:

- * One test pit was dug approximately ten feet east of the former UST area. No evidence of petroleum contamination was identified during the exploration. No visual or olfactory evidence of contamination was present on the water table nine feet below grade.

- * Stockpiled soils generated during the UST replacement were screened for volatile organic compounds using a photoionization detector (PID). Levels less than 1 ppm were observed. Consequently, these soils were thin spread onsite.

No sensitive receptors were identified that could be adversely impacted by any onsite contamination. Based on the above, the SMS is designating this site as Site Management Activity Complete (SMAC). A SMAC designation does not relieve the Town of Roxbury of the liability associated with any past or present contamination onsite. It does, however, mean that the SMS is not requesting any additional work in response to the January 10, 1996 UST removal at this time. The SMS appreciates your cooperation in conducting the necessary investigation at this site. Please feel free to call with any questions or concerns.

Sincerely,

George Besch, Chief
Sites Management Section
